

Product Management MVC

I created a Product Management API using the MVC (Model-View-Controller) architecture. The application allows managing products with fields like id, name, price, and category. It includes APIs for CRUD operations along with error handling and logging middleware.

Things Done Well

1. Proper MVC folder structure (routes, controllers, models)
2. Successfully implemented all CRUD APIs
3. Added middleware for logging and error handling

Improvements Needed

1. Improve ID generation to avoid duplicate IDs
2. Add input validation (name, price, category)
3. Use a database (MongoDB) instead of in-memory data
